Amendments to the Specification:

Please replace the paragraph beginning on page 1, line 17, with the following amended paragraph:

For example, in one scenario, a user may wish to send an email message to a recipient named "John Smith". If the user does not know the recipient's email address, the user may have to search for the address. To do so, the user could enter the term "John Smith" into a recipient field. A mail application could then search a database for all email addresses corresponding to recipients named "John Smith". If "John Smith" is a common name, the mail application may receive multiple search results for recipients having this name. When these results are displayed, the user may need to scan through each of these results and select the appropriate recipient from the list according to additional information that is also shown. For example, the results may show both name and location information. After scanning through the results, the user may choose the "John Smith" located in Philadelphia. Upon selection, the mail application inserts the corresponding email address into the recipient [[filed]]field of the message.
